

Quiza 2: Mecánica Clásica

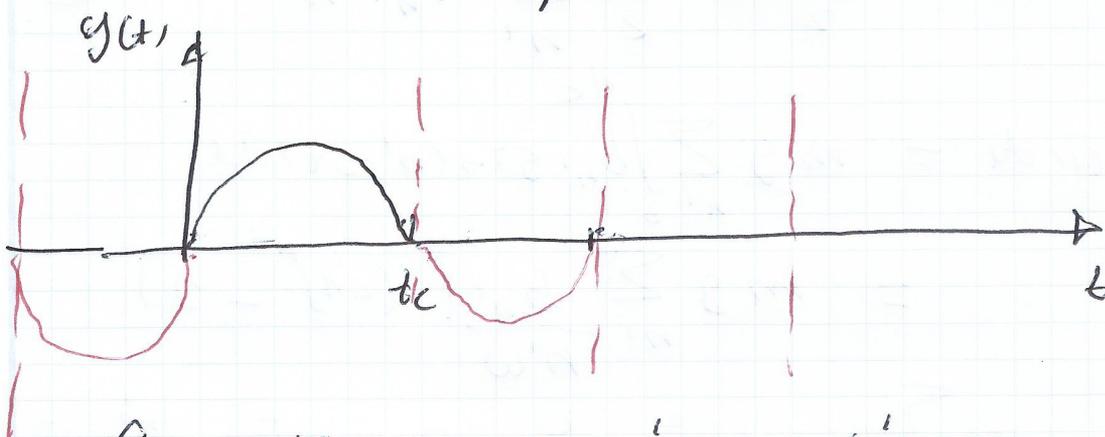

Principios Variacionales

PS

$$\begin{cases} y(0) = y(tc) = 0 \\ tc = \frac{2v_0}{g} \end{cases} \quad (1)$$

No usamos la serie de Fourier, sólo la prolongación impar.

En este caso $y'(0) = -y'(tc)$.
Lo cual es físicamente correcto.

$$y(t) = \sum_{n'} b_{n'} \sin(n' \omega t) \quad (2)$$

$$\text{con } \omega = \frac{\pi}{tc} \Rightarrow \begin{cases} y(0) = 0 \\ y(tc) = 0 \end{cases} \quad (3)$$

Vemos que n' debe ser impar como se puede verificar gráficamente.

El Lagrangiano es: $L = \frac{m\dot{y}^2}{2} - mgy \quad (4)$

$$S = \int_0^{tc} L dt = \int_0^{tc} T dt - \int_0^{tc} V dt \quad (5)$$

$$\text{de } \textcircled{2}: \dot{y}(t) = \sum_{n'} b_{n'} n' \omega \cos(n' \omega t) \quad \textcircled{6}$$

$$\int_0^{t_c} \frac{m}{2} \dot{y}^2 dt = \sum_{n', n''} \frac{m}{2} \omega^2 \int_0^{t_c} b_{n'} b_{n''} \cos(n' \omega t) \cos(n'' \omega t) dt. \quad \textcircled{7}$$

$$\text{Use } \int_0^{t_c} \cos(n' \omega t) \cos(n'' \omega t) dt = \delta_{n' n''} \frac{t_c}{2} \quad \textcircled{8}$$

$$\therefore \int_0^{t_c} T dt' = \frac{m \omega^2}{2} \frac{t_c}{2} \sum_{n'} b_{n'}^2 n'^2 \quad \textcircled{9}$$

$$\int_0^{t_c} m g y dt' = m g \sum_{n'} \int_0^{t_c} b_{n'} \sin(n' \omega t) dt$$

$$= m g \sum_{n'} \frac{b_{n'}}{n' \omega} [(-1)^{n'} - 1]$$

$$\therefore S = m \sum_{n'} \left[\frac{\pi \omega}{4} b_{n'}^2 n'^2 - \frac{g b_{n'}}{n' \omega} [(-1)^{n'} - 1] \right]$$

$$\frac{\partial S}{\partial b_n} = m \left[\frac{\pi \omega}{2} b_n n^2 - \frac{g [(-1)^n - 1]}{n' \omega} \right] = 0$$

\therefore Si n es par $\Rightarrow b_n = 0$.

- Si n es impar $\Rightarrow b_{2\ell+1} = \frac{4g}{\pi \omega^2 (2\ell+1)^3}$

$$y(t) = \sum_{\ell=0}^{\infty} \frac{8V_0}{\pi^2} \frac{1}{(2\ell+1)^3} \sin[(2\ell+1)\omega]t.$$

check:

$$\dot{y}(0) = \frac{8V_0}{\pi^2} \sum_{\ell=0}^{\infty} \frac{1}{(2\ell+1)^2} \Rightarrow \boxed{\dot{y}(0) = V_0}$$

$\pi^2/8$
